

Timeclock/Kronos® Integration

Using the Timeclock/Kronos® integration tool, V Sys One can accept clock records from your timekeeping system. This lets your volunteers clock in and out using the same badges and clocks that your employees use: much more convenient, and lower hardware costs.

How it works

The Timeclock Integration Tool accepts clock-in and –out data from your timekeeping system. It uses the employee ID from that system to match volunteers, then determines the jobs and assignments that it thinks are appropriate.

You configure the integration to run your way:

- Import schedule
- Require approval/validation
- Default values
- Field mappings from your timekeeping system.

And of course V Sys One gives you the tools to validate and report on everything that's imported.

V Sys Kiosk

You can still use V Sys kiosks for more complex interactions (send/receive messages, surveys, etc.), of course.

System requirements

This integration is an optional tool which is built into V Sys One itself and connects to the same database as V Sys One.

- A V Sys One-compatible desktop
- Exported data from your timekeeping system.

Licensing/pricing

Timeclock Integration is licensed on a per-site basis with no restrictions on the number of volunteers in V Sys One.

Support and maintenance

The Timeclock Integration Tool comes with the same great support you get with V Sys One.

- The first twelve months are included without charge
- After the first twelve months, support and maintenance are 20% of your initial license price /year.
- Includes 10 hours of installation, configuration and “process” help from our staff.

(Our Timeclock Integration Tool was previously named the "Kronos® Integration Tool".)
